

Liquid Nitrogen Aftercare:

1. For the first 24 hours the area might sting, this is normal.
2. The area may blister and appear red but keep the blister intact. DO NOT place a bandage over it because this will make the healing process longer.
3. Once the blister, Natalie falls off, spread a light layer of Aquaphor/Bacitracin/Neosporin over the area twice a day.
4. When the area has healed completely, make sure to have an SPF higher than 20 on your skin to protect not only the area, but the rest of your skin as well.

Call us if you have any questions or concerns.
